Correlations determine the response
Exact $(2t-1)^2$
Known $\langle X^{\otimes m}\rangle^2$
Bell: 2-qubit exchange
GHZ: 3-qubit exchange
Dephasing response D_{Z_1}
Mixture weight t
Every one-qubit marginal stays maximally mixed
Global parity $\langle X^{\otimes m}\rangle$
All local $\langle X_j\rangle, \langle Y_j\rangle, \langle Z_j\rangle$
Expectation
Mixture weight t
